5/19

Line segment intersection cases

The two bounding boxes associated with the first two tuple-pairs from both features intersects as shown to the right

Case 1

The bounding boxes associated with the second set of tuple-pairs do not intersect

Case 2

In the case to the right, two black line segments must be elevated for intersection with a single dashed line segment

Case 3

10/19

Entry/Exit Relationship	Class	Begin point for first cycle (inside is " to the right ") Intersection	Begin point for first cycle (inside is " to the right ") Union	Begin point for first cycle (inside is " to the left ") Intersection	Begin point for first cycle (inside is " to the left ") Union
$D_E D_X S_E S_X$	I	First intersection point of solid or dashed feature (Null if no intersect points)	Pseudo points (S_E and D_E)	Pseudo points (S_E and D_E)	First intersection point of solid or dashed feature (Full cell if no intersect points)
$D_E S_X S_E D_X$	II	Pseudo points (S_E and D_E)	First intersection point of solid or dashed feature (Full cell if no intersect points)	First intersection point of solid or dashed feature (Null if no intersect points)	Pseudo points (S_E and D_E)
$D_E S_E S_X D_X$	III	Pseudo point S_E	Pseudo point D_E	Pseudo point D_E	Pseudo point S_E
$D_E S_E D_X S_X$	VI	Pseudo point S_E	Pseudo point D_E	Pseudo point D_E	Pseudo point S_E
$D_E D_X S_X S_E$	IV	Pseudo point D_E	Pseudo point S_E	Pseudo point S_E	Pseudo point D_E
$D_E S_X D_X S_E$	V	Pseudo point D_E	Pseudo point S_E	Pseudo point S_E	Pseudo point D_E

Application of table:

Follow specified boundary entrance feature, accumulating intersection and/or union cycles until all polyline intersection point tuples in the cell have been exhausted.

Cycles alternate systematically along the specified entrance feature between contributions to intersection and union.

Cycles are completed when they close on themselves. The implicit boundary-closing segments of a boundary-closing cycle are not actually represented in the general product.

Comments:

As is apparent from the above formulation, intersection and union are effectively dual operations. The set operation generation procedure is similar regardless of the ordering convention of the polygon tuples (clockwise or counter-clockwise oriented), reflected in the symmetry observed within the above table.

Note that the classes are grouped into pairs. Classes I and II involve inverse operations;

Classes III and VI employ identical generation operations, as do Classes IV and V.

FIG. 21

Class V:
 $D_S D_S$
 $E X X E$
 # intersections = odd

intersections = 1
 # intersection cycles = 1
 # union cycles = 1

intersections = 3
 # intersection cycles = 2
 # union cycles = 2

FIG. 22

Class VI:
 $D_S D_S$
 $E E X X$
 # intersections = odd

intersections = 0
 # intersection cycles = 1
 # union cycles = 1 (or 2)

intersections = 3
 # intersection cycles = 2
 # union cycles = 2

16/19

Class I:
 $D_E D_X S_X S_E$
 $E_X E_X$
 # intersections = even

intersections = 0
 # intersection cycles = 0
 # union cycles = 1

intersections = 2
 # intersection cycles = 1
 # union cycles = 2

Class II:
 $D_E S_X S_E D_X$
 $E_X E_X$
 # intersections = even

intersections = 0
 # intersection cycles = 1
 # union cycles = all cell within

intersections = 2
 # intersection cycles = 2
 # union cycles = 1
